

Clinical Documents on FHIR

Rick Geimer

Lantana Webinar, June 12, 2018

Rick Geimer (rick.geimer@lantanagroup.com)

- Member of the HL7 CDA Management Group, FHIR Infrastructure Work Group, Structured Documents Work Group, and Attachments Work Group.
- HL7 CDA R2 Certified Specialist, Certified FHIR Proficient
- Co-Editor, CDA Consolidation and many other implementation guides
- Lead: C-CDA on FHIR project
- Day job: Lantana Chief Innovation Officer

Lantana Consulting Group

- Our Mission:
 - Improve healthcare through health information technology (IT)
 - Lead the industry through our consulting and volunteer practice
- Our Services:
 - *Strategic advice for health IT planning, design, & purchasing*
 - Development & implementation
 - Terminology, data governance, & education

- Overview of Electronic Clinical Documents
- FHIR documents
- C-CDA on FHIR and US Core
- Converting data to/from C-CDA and FHIR
- Current/Future Work and Resources

Community Health Hospital
Discharge Summary

DESCRIPTION: Acute cerebral infarction of the right parietal lobe, hypertension

DISCHARGE DIAGNOSIS:
1. Acute cerebrovascular disease
2. Hypertension
3. Urinary tract infection
4. Hypercholesterolemia

PROCEDURE:
1. On 3/26/11, patient underwent a CT scan of the head without contrast. The study was performed with the patient in the supine position. The study was performed with the patient in the supine position. The study was performed with the patient in the supine position.

HISTORY:
15 years, right-sided numbness by EMS. The patient was given aspirin in the ambulance. The patient could not have a CT scan of the head because of the deep white matter of the middle cerebral artery.

ALLERGIES, ADVERSE REACTIONS, ALERT:

Substance	Reaction
ALLERGENIC EXTRACT, PENICILLIN	Itaque
Cloasma	Whaeing
Aspirin	Hives

ASSESSMENT:
1. Recurrent (2) brief of unknown etiology, hypertension seems secondary to this but as likely secondary to polypharmacy.
2. Acute on chronic anemia secondary to #1.
3. Systemic acute renal failure with volume loss secondary to #1.
4. Hypertension secondary to #2 and on ACE and/or supplement.
5. Other chronic diagnoses as noted above, currently stable.

REASON FOR VISIT/CHIEF COMPLAINT:
Date: 3/26/11

FAMILY HISTORY:

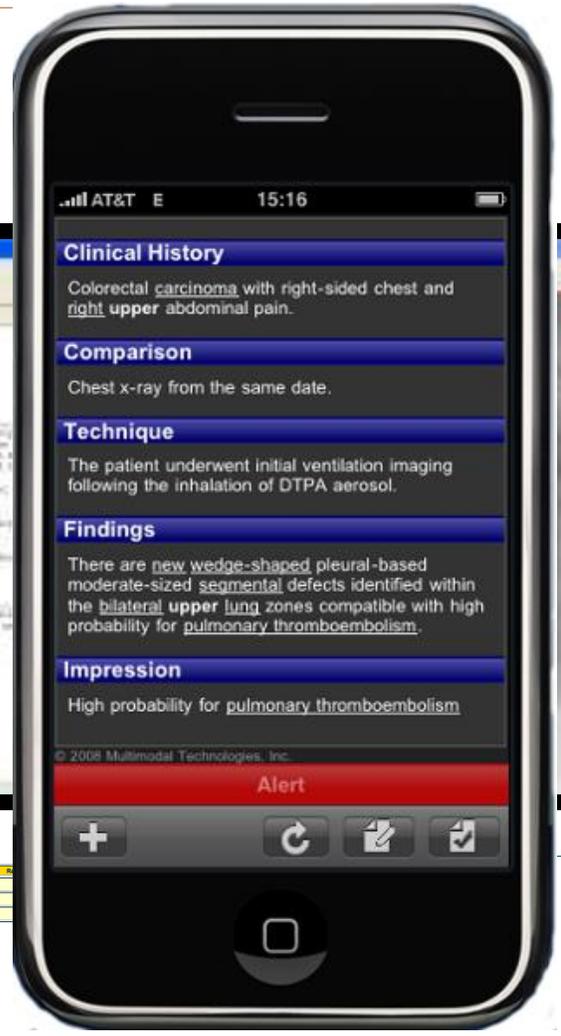

Diagnosis	Age At Onset
Myocardial Infarction (cause of death)	37
Dementia	40

- **Persistence** – A clinical document continues to exist in an unaltered state, for a time period defined by local and regulatory requirements. Note: documents outlive the servers (and often the syntax) on which they are created.
- **Stewardship** – A clinical document is maintained by an organization entrusted with its care.
- **Potential for authentication** – A clinical document is an assemblage of information that is intended to be legally authenticated.
- **Context** – A clinical document establishes the default context for its contents.
- **Wholeness** – Authentication of a clinical document applies to the whole and does not apply to portions of the document without the full context of the document.
- **Human readability** – A clinical document is human readable.

Clinical Document Architecture (CDA)

- A **specification for exchange of clinical documents**, defining their structure and semantics
- **ANSI/ISO standard** developed by HL7's Structured Documents Work Group (SDWG)
- **Base standard** on which many Implementation Guides (IGs) are built:
 - Quality Reporting Document Architecture (QRDA)
 - Healthcare Associated Infection (HAI) Reports
 - Consolidated CDA (C-CDA)
 - ...and many others

Consolidated CDA (C-CDA)

- HL7 Consult Note
- HL7 Diagnostic Imaging Report
- HL7 Discharge Summary
- HL7 History and Physical
- HL7 Operative Note
- HL7 Procedure Note
- HL7 Unstructured Documents
- HL7 Progress Notes
- HL7 Continuity of Care Document
- HITSP/C84 Consult and History & Physical Note Document
- HITSP/C32 - Summary Documents Using HL7 CCD
- HITSP/C48 Referral and Discharge Summary Document constructs
- HITSP/C62 Scanned document

Consolidate and harmonize various standalone documents into one master implementation guide for the primary care use case.

Later versions added additional document types such as the Care Plan document type.

Grahame's Law:

- You can hide complexity, or **make it worse**, but you can't make it go away.

HL7 V3 was more complex than necessary.

- Simple technical problems became road-blocks for many implementers.

CDA was the stable, simpler part of HL7 V3.

- But inherited much of the V3 complexity
- Never had a viable API complement

FHIR makes many simple problems simple again.

- Lets implementers focus on solving the hard problems.

Many CDAs today are just EHR data dumps.

- FHIR Queries can serve the same purpose with more specificity.
- The future: fewer data dump documents, more clinically relevant documents

F – Fast (to design & to implement)

- Relative – No technology can make integration as fast as we'd like

H – Health

- That's why we're here

I – Interoperable

- Ditto

R – Resources

- Building blocks – more on these to follow

FHIR is like Lego(™) for Healthcare

- Resources = Blocks
- Resources are discrete chunks of clinical information
- Resources can be assembled into larger constructs
- You operate on resources via FHIR's REST APIs - like programming Lego Mindstorms (™)

Similarities

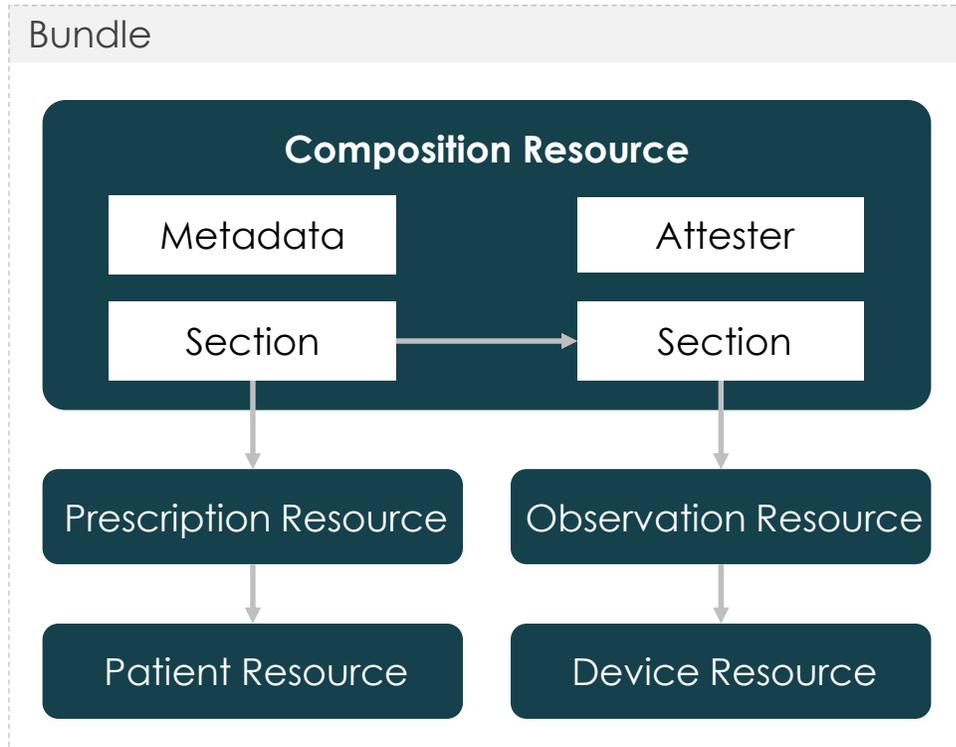

- Support profiling for specific use-cases
- Human readability is minimum for interoperability
- Validation tooling, profile tooling

FHIR Differences

- Can use out of the box – no templates required (but profiling still recommended)
- Encompasses documents, resources, messages, and APIs (i.e. not just a document exchange format)
- Implementer tooling generated with spec

- Address CDA use case for clinical documents
- Collection of resources bound together
 - Root is a Composition resource
 - Much like the CDA header + narrative
- Sent as a Bundle resource
- Can be signed, authenticated, etc.
- A FHIR document has the same basic obligations as a CDA document
- Full rules
 - <http://build.fhir.org/documents.html>

FHIR Documents: Bundles of Resources

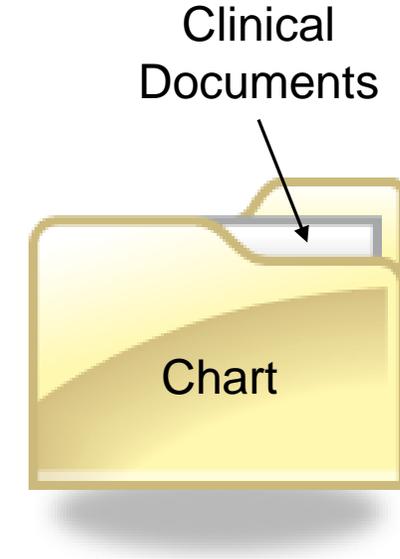

```
<Bundle>
  <entry>
    <Composition /> ●
  </entry>
  <entry>
    <Observation /> ●
  </entry>
  <entry>
    <Device /> ●
  </entry>
  <entry>
    <Prescription /> ●
  </entry>
  <entry>
    <Patient /> ●
  </entry>
</entry>
</Bundle>
```

Contains

- Patient
- Author
- Custodian
- Type of document (e.g., Discharge summary)
- Attested narrative of the document

Sufficient for

- Medical records management
- Document management
- Enable clinical document exchange across and within institutions
- Human readable documents

- Composition resources contain sections (which may be nested)
- The section narrative markup is XHTML
- The narrative contains the attested text of the document
- It is ok for sections to consist of only human readable text (i.e., no machine processable resources)

```
<section>
  <title value="Allergies and Intolerances"/>
  <code>
    <coding>
      <system value="http://loinc.org"/>
      <code value="48765-2"/>
      <display value="Allergies and adverse reactions"/>
    </coding>
  </code>
  <text>
    <status value="generated"/>
    <div xmlns="http://www.w3.org/1999/xhtml">
      <ul>
        <li>Penicillin - Hives</li>
        ...
      </ul>
    </div>
  </text>
  ...
</section>
```

Allergies and Intolerances

- Penicillin - Hives

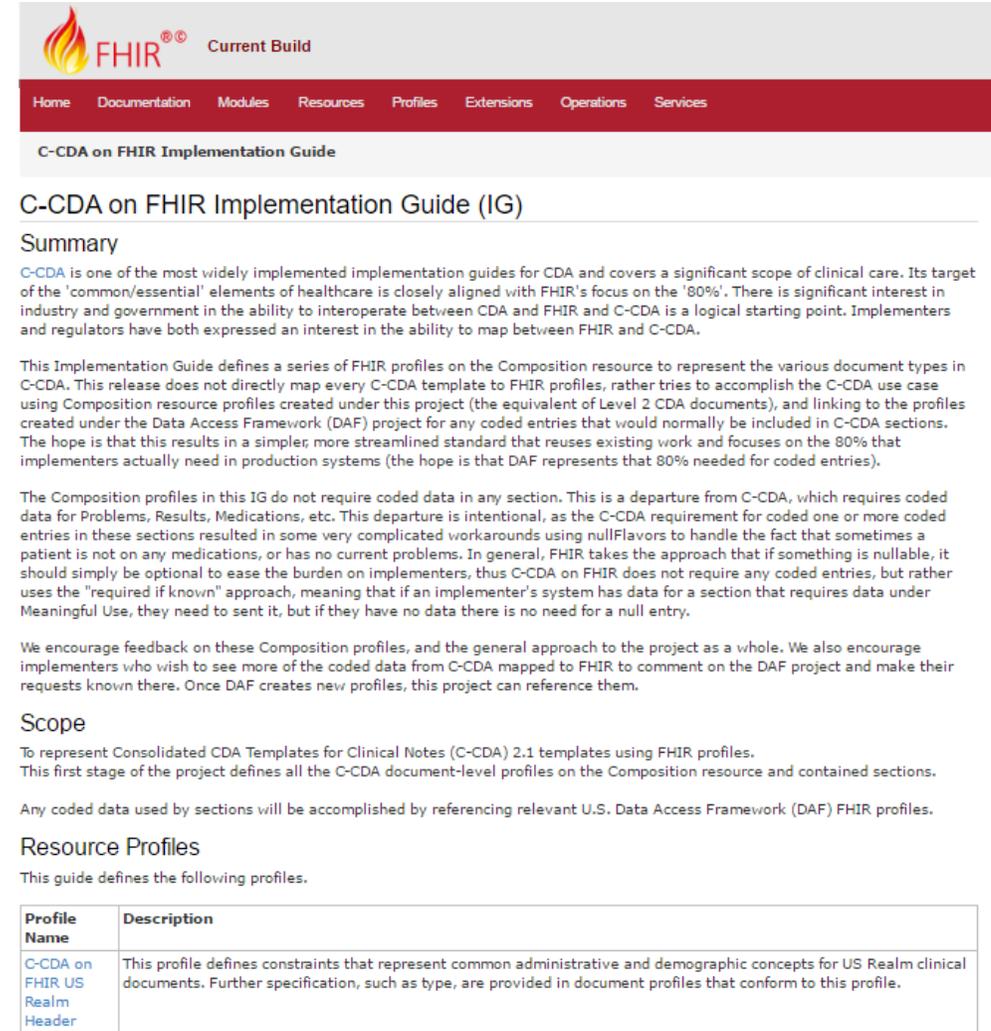

Next: Coded Data

```
<AllergyIntolerance xmlns="http://hl7.org/fhir">
  <clinicalStatus value="active"/>
  <verificationStatus value="confirmed"/>
  <category value="medication"/>
  <criticality value="high"/>
  <code>
    <coding>
      <system value="http://snomed.info/sct"/>
      <code value="418038007"/>
      <display value="allergy to penicillin"/>
    </coding>
  </code>
  <patient>
    <reference value="Patient/1"/>
    <display value="Henry Levin"/>
  </patient>
```

```
<assertedDate value="2000"/>
  <reaction>
    <manifestation>
      <coding>
        <system value="http://snomed.info/sct"/>
        <code value="247472004"/>
        <display value="hives"/>
      </coding>
    </manifestation>
    <severity value="mild"/>
  </reaction>
</AllergyIntolerance>
```

US Realm FHIR Implementation Guide

- Goal:
 - FHIR profiles for the C-CDA use case
- Scope
 - Represent C-CDA templates using FHIR profiles
 - Focus on C-CDA document-level profiles using the Composition Resource
 - Coded entries limited to US Core profiles via the 80/20 rule.

The screenshot shows the FHIR Current Build website. The top navigation bar includes links for Home, Documentation, Modules, Resources, Profiles, Extensions, Operations, and Services. The main content area is titled "C-CDA on FHIR Implementation Guide" and includes a "Summary" section. The summary text states that C-CDA is one of the most widely implemented implementation guides for CDA and covers a significant scope of clinical care. It also mentions that the implementation guide defines a series of FHIR profiles on the Composition resource to represent various document types in C-CDA. The "Scope" section notes that the profiles do not require coded data in any section, which is a departure from C-CDA. The "Resource Profiles" section states that the guide defines the following profiles:

Profile Name	Description
C-CDA on FHIR US Realm Header	This profile defines constraints that represent common administrative and demographic concepts for US Realm clinical documents. Further specification, such as type, are provided in document profiles that conform to this profile.

Published specification

- <http://hl7.org/fhir/us/ccda/index.html>

Current build

- <http://build.fhir.org/ig/HL7/ccda-on-fhir/>

This is the Continuous Integration Build of FHIR (will be incorrect/inconsistent at times). See the [Directory of published versions](#)

Welcome to FHIR®

First time here? See the [executive summary](#), the [developer's introduction](#), the [clinical introduction](#), or the [architect's introduction](#), and then the [FHIR overview / roadmap](#). See also the [open license](#) (and don't miss the full [Table of Contents](#) or you can search this specification).

 Clinical Reasoning	Decision Support, Clinical Quality Measures			
 Clinical	 Diagnostics	 Medications	 Workflow	 Financial
Allergy, Problem, etc.	Observation, Report, Request, etc.	Order, Dispense, Administration, Statement, etc.	Task, Subscription, etc.	Claim, EligibilityRequest, etc.
 Administration	Patient, Practitioner, Device, Organization, Location, Healthcare Service			
 Implementer Support	 Security & Privacy	 Conformance	 Terminology	 Ontology
Downloads, Common Use Cases, Testing	Security, Consent	StructureDefn, CapabilityStatement, Profiling	CodeSystem, ValueSet, ConceptMap, Terminology Svc	RDF
 Foundation	Base Documentation, XML, JSON, REST API + Search, Data Types, Extensions

Converting between C-CDA and C-CDA on FHIR

Why?

- Quick way to get a critical mass of FHIR documents
- Continuity with existing practice, using better syntax and APIs
- Creating FHIR documents and converting to CDA may be an easier way for developers to comply with today's regulations
- Supports transitional strategies with mixed environments

How?

- Future:
 - C-CDA to FHIR mapping project
 - HL7 sanctioned mappings defined using FHIR Mapping Language
 - Project began in May 2018, completion in Sept 2019
- Current
 - Various non-HL7 solutions (some proprietary, some open)
 - Example: ONC-HIP Pharmacist Care Plan transforms

Live Demo

- **ONC-HIP Pharmacist Care Plan (PhCP) transforms using XSLT**

- Documents are persistent objects
- Thus they must be stored somewhere (or reproduced exactly on demand)
- Options:
 - FHIR server (/Bundle or /Binary endpoint)
 - Document management system
 - Clinical data repository
 - Database
 - File system
 - etc.
- **Important:** documents cannot be generated, transmitted, then disposed of like an message. They are a persistent part of the patient record.

FHIR validation pack

- Includes XML Schema and Schematron files
- <http://build.fhir.org/fhir-all-xsd.zip>
- FHIR Validator (Java Tool)
- <http://build.fhir.org/validator.zip>

FHIR server validation

- Most servers do basic resource validation
- Use the \$validate operation
 - Can validate profiles like C-CDA on FHIR
 - <http://build.fhir.org/operation-resource-validate.html>

- Unstructured Documents (US Core DocumentReference profile)
- Section entry profiles not covered by US Core
- Other CDA IGs as driven by demand
- C-CDA to FHIR Mapping Project
 - Promises C-CDA to FHIR Mappings using FHIR Mapping Language
 - Starting now, ending close of 2019

- FHIR evaporates “V3 messaging”
- V2: if not broke... don't replace
- CDA
 - FHIR retains CDA document concepts
 - Improves text/data management
 - Unified model/syntax with messages/API
- C-CDA on FHIR
 - Ready for trial use
 - Limited production
 - Needs more testing/implementation
